TITLE: Effect of some metallic impurities on electrical and thermal properties of hexagonal selenium

PERIODICAL: Referativnyy zhurnal, Fizika, no. 5, 1962, 29, abstract 5E231  
("Izv. AN AzerbSSR Ser. fiz.-matem. i tekhn. n.", 1961, no. 4, 37 - 44; Azerb. summary)

TEXT: It is shown that Bi and Cd impurities up to a specific content (0.04% Bi and 0.125% Cd) reduce the thermal conductivity of Se, but raise it if their content is increased further. Bi, Cd, and Ga impurities raise the electrical conductivity of Se. Ga raises it to a higher degree than Bi and Cd. Bi and Cd impurities reduce the thermo-emf of Se, whereas Ga raises it. The thermo-emf of both pure and impurity-containing Se grows with temperature. The sign of the thermo-emf of both pure Se and Se containing Bi, Cd, and Ga impurities, is indicative of the hole mechanism of the carriers.

TITLE: Electric properties of gallium-doped selenium

PERIODICAL: Referativnyy zhurnal, Fizika, no. 12, 1961, 359, abstract 12E481  
(Dokl., AN AzerbSSR, 1961, v. 17, no. 13, 191 - 196, Azerb. summary)

TEXT: The effect of gallium-doping on the electric conductivity  $\sigma$  and thermo-emf  $\alpha$  of Se was investigated. Doping with up to 0.125 wt % Ga causes  $\sigma$  of Se to increase almost 160 times, after which  $\sigma$  slowly decreases with increasing Ga content.  $\alpha$  of specimens with different Ga content was measured in the range 20° - 200°C. The sign of  $\alpha$  always points to p-type conductivity. The temperature dependence of hole mobility  $\mu_p$  for different Ga content is plotted. In specimens containing 0.125 wt % Ga,  $\mu_p$  at first decreases sharply, then remains constant. In the rest of the specimens,  $\mu_p$  increases with temperature.

TITLE : Influence of Molybdenum and Cobalt On Oxygen  
Reduction Processes In Plants  
ORIG. PUB. : Dokl. AN, Azerb. SSR, 1958, 14, No. 6, 465-469  
ABSTRACT : In field experiments Mo caused a considerable  
increase of ascorbic acid content and peroxidase  
activity in leaves of wheat during grain ripening  
and also a sharp increase of iodine reducing  
activity, ascorbic acid content, catalase activity,  
and r a t e of photosynthesis in cotton during  
boll formation. Under the influence of Co an  
increase of catalase activity was observed in  
cotton; the influence of Co on the other character-  
istics of wheat and cotton studied was negligible.—  
M. B. Shternberg.

ABSTRACT : produced a decrease in the water content in winter. B produced an increase and Mn, Cu, and Zn - a decrease in the transpiration in winter period. All of the microelements (especially Mn and Cu) produced a considerable decrease in the loss of water by wilted leaves. Mn and Cu raised the concentration of the cell sap; B and Zn did not show a similar effect. Conclusion is made that an increase in the waterholding power in wheat leaves under the influence of B and Zn is explained by an increase in the amount of hydrophilic colloids, and under the influence of

PERIODICAL: Uch. zap. Azerb. un-t, 1956, Nr 6, pp 51-58

ABSTRACT: Vegetation growing on rocky and stony outcrops of  
Apsheron and of southeastern Kabristan in Eastern  
Transcaucasia assumes a very wide variety of forms.  
It is represented by the following species: trees--  
Caucasian hackberry, smooth hackberry, and tannic  
sumach; shrubs--Caucasian juniper, Pallas buckthorn,  
clustered cotoneaster, Kuzmich grass, dwarf cherry,  
Georgian mezereon, jasmine, and Caspian astragalus;  
semi-shrubs--Karyagin summer savory, felt germander;

Card 1/2

## . Apsheron Cliff Vegetation (Cont.)

perennial grasses--trailing woodruff, Shovits stipae, curling stipae; ferns--Ceterach officinarum, Asplenium, Ruta, muraria, Anogramma leptophyllum, Cheilanthes persica. Ephemeral plants grow among the outcrops. Typical rock cover of such places is represented by lichens, the most common of which are Caloplaca aurantia, Xanthoria calciola, Tokinia coeruleo nigrans, Fulgenisia bylgens, Placodium lentigerum, and others. The author describes those species which would serve best as decorative plants for the dry slopes near the city of Baku and elsewhere in Apsheron. The article includes sketches.

ABSTRACT : Data of the Institute of Agriculture, Academy of Sciences  
Azerbaijan SSR. The influence of B, Mn, Cu, and Zn added  
to a background of nitrogen and phosphoric fertilizers was  
studied. These elements improved the wintering of the  
plants, accelerated growth, the vigor of tillering (espe-  
cially Mn and Cu) and the ripening of the grain (Cu). Un-  
der the influence of Zn and then B, the number of the ker-  
nels on the spike increased. Application of different mi-  
croelements is reflected differently on the water cycle of

TITLE: The Use of Flame instead of Steam Heating on a Primary Rectification Plant for Light Pyrolysis Oil (Primeneniye v pervichnoy rektifikatsionnoy ustanovke dlya piroliznogo legkogo masla ogneвого podogreva vzamen parovogo)  
PERIODICAL: Koks i Khimiya, 1958, Nr 9, pp 53-56 (USSR)  
ABSTRACT: Experience in the treatment of petroleum light oil similar in composition to raw benzole in a pipe still is described. After successful initial experiments on a laboratory installation (Tables 1 and 2) the primary rectification plant for light pyrolysis oil on the "Neftegaz" works was transferred from steam to flame heating. The scheme of the installation is outlined. The economy achieved in the first year of operation amounted to 350,000 roubles. There are 2 tables and 7 references (all Soviet)

TITLE: New Flow Scheme for Production of Petroleum Varnish Oil (Novaya skhema proizvodstva neftyanogo lakoylya)

PERIODICAL: Neftyanik, 1958, Nr 12, pp 11-13 (USSR)

ABSTRACT: According to this article, the best way to protect petroleum equipment from corrosion is to coat it with some sort of paint or varnish. The production of paint and varnish requires, however, a considerable quantity of vegetable oil which is badly needed as food stuff. Therefore it is desirable to use some kind of synthetic petrochemical product as a substitute. One of these synthetic products, which easily forms a film, is the petroleum varnish oil produced in pyrolysis plants from sour goudron and alkaline pyropolymer. This is described by the author and shown in the flow chart of (Fig. 1). Tables 1 and 2 present the characteristics of the sour goudron and alkaline pyropolymer used for production of the varnish oil. When the latter is produced in accordance with the flow scheme shown in (Fig. 1), its water content reaches 6 - 10 percent. This is undesirable, as is the presence of sodium bisulfate which is formed during the neutralization of sour polymer effected with the aid of alkaline polymer. Therefore, a group of engineers of the Baku Plant "Neftegaz"im. Baidenny proposed substituting the original

Card 1/2

New Flow Scheme for Production (Cont.)

SOV/92-58-12-8/24

flow scheme with the revised flow scheme shown in (Fig.2). As a result of this proposal, the quality of varnish oil was improved, the throughput of the equipment increased, and the number of repairs needed by the equipment dropped. In Table 3 the author indicates properties of the solvent "nafta", and in Table 4 the properties of the finished varnish oil. There are 2 figures and 4 tables.

TITLE: Pyrolysis of the Gas Condensate From the Karadag Deposit and of the Gasoline Fraction Recovered From a Mixture of This Condensate With Petroleum for the Purpose of Xylene Production

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Neft' i gaz, 1960, No. 12, pp. 79 - 83

TEXT: The authors performed laboratory experiments in order to establish which raw material and which optimum temperatures in pyrolysis are most appropriate for the production of xylene. Since the pyrolysis of light crude material is highly important, a condensate recovered from Karadag gas well and a gasoline fraction were used. Pyrolysis was performed with and without water vapor (10%) at temperatures ranging from 700 to 770°C in a laboratory-type or combined unit; the latter consists of two interconnected pipe stills. In the first, overheated water vapor is generated,

while pyrolysis is performed in the second one. A xylene fraction was recovered from the material in question, which is suitable for isolating the xylene isomers. Optimum temperature, at which the highest xylene-fraction yields (2 - 2.4%) are obtained, is 740°C. There are 1 figure, 3 tables, and 5 Soviet references.

TITLE: Investigation of the water condensate from the gas separator of pyrolysis equipment

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 4, 1964, 30-32

TOPIC TAGS: pyrolysis, by product, condensate, composition, stability, thermooxidation, atomic oxygen formation, free radical formation, acid, ketone, alcohol, water vapor decomposition, heat transfer agent, hydrocarbon, hydrocarbon pyrolysis, high temperature pyrolysis

ABSTRACT: The composition of the water condensate from the bottom of a gas separator of a pyrolysis apparatus was examined to determine the nature of the synthesis products, to determine the stability of the condensate on storage and to confirm the assumption that thermo-oxidative reactions occur as a result of atomic oxygen from the water vapor (Aliyev, V.S., Kasimova, N.P., Al'tman, N.B. Vliyaniye vodyanogo para na vy\*sokotemperaturny\*y krekning gasoylya. "Effect of water vapor on high temperature cracking of gas oil." Khim. i.

tekhmol. topliv i masel No. 8, 1958). The condensate is a slightly emulsified milky material,  $n_D^{20} = 1.3338$ . On storage, a number of color changes occur but there is no change in refractive index. These changes are attributed to small amounts of free radicals and condensed high molecular aromatic hydrocarbons. The aqueous condensate contains a definite amount of oxygen-containing compounds of different classes: acids (up to 800 mg/l, formic, acetic, propionic and small amounts of butyric and other high molecular acids), ketones (0.25 wt.%, acetone, methylethylketone, diethylketone, and small amounts of higher ketones), and alcohols (0.015-0.9366 wt.%, methanol, ethanol, propanol, isopropanol, some butanol and higher alcohols). This indicates side reactions in the pyrolysis process involving oxygen formed by the decomposition of water vapor to its components. This refutes the opinion (Ostgaus, K.G., Zhurnal "Neftekhimicheskiy sintez za rubezhom" "Petrochemical synthesis abroad". vy\*p. 5, ITEIneftegaz, 1962, str. 50-56) that in high temperature pyrolysis of hydrocarbons the role of a heat transfer agent is fulfilled solely by water vapor. AUTHOR: Aliyev, D. A.; Aliyeva, S. G.; Dubrovko, R. V.

TITLE: Methods of conversion and utilization of resin formed in the dehydrogenation of ethylbenzene to styrene

SOURCE: Neftepererabotka i neftekimiya, no. 12, 1964, 32-35

TOPIC TAGS: polystyrene, benzene, dehydrogenation

Abstract: Styrene resin forms in the dehydrogenation of ethylbenzene to styrene. Its amount is 3.5-4% with reference to styrene. Ways of utilizing this resin without thermal depolymerization were investigated. Styrene resin with a molecular weight of 405, stripped of styrene by steam distillation and combined with 80% xylene or other hydrocarbon solvents, was not a suitable material for finished insulating varnishes with respect to appearance and (on one sample) drying time, but may still present possibilities from the standpoint of application in varnishes. A polymer fraction of the resin with a molecular weight of 933 was separated from the resin in an amount of 46-50% by treatment with gasoline, in which this fraction was insoluble. This polymer fraction proved a good material for the compression molding of plastic articles for industrial use. The obtained plastic soft-
